

Titanium

The newest member of the precious metals family, artists call it "the most intriguing metal ever".

The first new element to enter the noble metals arena of silver, platinum and gold in over 3000 years. Titanium is a refractory metal and naturally gray. The application of heat or electricity unleashes its refractive properties, resulting in amazing colours. This is a natural oxidation process and will stay permanently.

Titanium is extremely lightweight, durable and strong - it is 100% hypoallergenic, does not tarnish or react with the body or chemicals.
